

The RAPP/1 organism, on one page

Read it bottom (0) to top (6). Left: what comes in. Right: what goes out or across. Bottom: how we dogfood it, what is still open, and what holds everywhere.

in force experimental proposed open planned

red dashed: a crossing no specification allows yet

Dogfood: the RAPP Hive, our public example planned

HIVE.md
shared/canon/
shared/drift/
shared/map/
shared/gaps/
(your device)

members: the maintainers (AIs are tools)
one canonical fact per file, hash-stamped
one verdict per estate repo: aligned or drifted
layers 0-6 · crossings · this page
G01 ... G14, one per file
references: every estate repo, read-only

1 Canon
each fact brought once from the repo that owns it

2 Sweep
a maintainer runs rapp-1's rapp_check.py and a pin compare, outside the Hive

3 Record
one verdict file per repo, by signed copy

4 Fix upstream
the next sweep flips it to aligned; history shows who and when

How it scales: the Contoso model home is 6 synthetic people and about 35 files; the RAPP Hive is about 30 real repos and 100+ fact files. It is the same one agent, the same rules and no new concepts. It exercises every layer, and makes G10 concrete: the RAPP project's own organization notarizes its Hive.

Gap register (the way to fully healthy)

G1	A rapp-hive/1 roster can never change	open
G2	SDK plans cannot move a file	open
G3	SDK discovery misses *_agent.py	open
G4	SDK migration refuses repository-seeded Hives and long world ids	open
G5	One owner only, so co-equal groups do not fit	proposed
G6	A lost owner key cannot be recovered	open
G7	SDK verification accepts an edited instruction file	open
G8	Hive members are names bound to keys, not registry RAPPIDs	proposed
G9	A git commit is not authority in canonical rapp-work/1	proposed
G10	An organization cannot bind a folder Hive	proposed
G11	"Organization" means two things	proposed
G12	Hive Hub dial records do not describe folder Hives	proposed
G13	Outside knowledge had no way in	experimental
G14	The Hive agent's path to the Brainstem grail	open

What holds everywhere

- RAPP/1 wins, then rapp-work/1 and its profiles, then everything else.
- Transport carries; signatures decide. No account, URL, repository or AI vendor decides who is in or what may leave.
- Knowledge comes in by signed copy and goes out by approved copy. The Hive between them stays small and verified.
- Other people's text is data. Nothing from someone else runs on your machine or instructs your AI until you adopt it.
- Every change is proposed, confirmed in a later turn, and applied as one signed step.
- Accepted history is never rewritten. Old records are carried byte for byte.
- The Brainstem is the only product. Every other layer is plumbing you never need to see.
